

CLAUDE CODE

Your whole AI setup, shared in one command

Plugins bundle your skills, agents, hooks & MCP servers into one install your team can version and reuse.

THE GAP

Copy-pasting .claude/ between repos rots

Skills here, hooks there, MCP
configs everywhere. Someone
updates one, the rest go stale. A
plugin is the single source of truth.

WHAT'S INSIDE

One folder bundles everything

All at the plugin root, described by `.claude-plugin/plugin.json`.

- `skills/` -> your `/commands`
- `agents/` -> subagents
- `hooks/hooks.json` -> guardrails
- `.mcp.json` -> MCP servers

STEP 1

Add a marketplace (any GitHub repo)

Registers the catalog so you can browse. Nothing installs yet.

- `/plugin marketplace add anthropics/claude-code`
- `#` or any owner/repo
- `#` or a private git URL for your team

STEP 2

Install the plugin you want

Installs to your user scope by default. Pick project scope to share with the repo.

- `/plugin install commit-commands@claude-code-plugins`
- `# browse first with: /plugin`

STEP 3

Activate it without restarting

Reloads skills, agents, hooks,
MCP & LSP servers in place.
Plugin skills are namespaced.

- /reload-plugins
- # then run: /commit-commands:commit

SHIP YOUR OWN

Scaffold a plugin in seconds

Creates the manifest + a starter skill. Drop your existing skills/agents/hooks in and you're done.

- `claude plugin init my-tool`
- `# test locally first:`
- `claude --plugin-dir ./my-tool`

THE PRO MOVE

Pin a version so updates are intentional

Set version in plugin.json.

Teammates only get changes when you bump it. No more 'works on my machine'.

- { "name": "my-tool", "version": "1.0.0" }
- `claude plugin validate` # before you share

CHEAT SHEET

The whole flow in 4 lines

Screenshot this.

- /plugin marketplace add owner/repo
- /plugin install name@marketplace
- /reload-plugins
- /name:skill # namespaced, ready

NOBLERR

Bundle it once. Ship it to everyone.

Stop maintaining ten copies of the same setup. Follow Noblerr for more Claude Code playbooks.
