

CLAUDE CODE · AI ENGINEERING

Agent skills

Teach your coding agent to work the way your team does. 5 worth installing this week — plus the one that finds the rest.

THE IDEA

What is a skill?

A SKILL.md file: a name, a description, and instructions. It hands your agent a reusable capability — write it once, it loads every session. No more re-explaining yourself.

SETUP

Install in one line

Add any skill to your project, then point it at your agent:

- `npx skills add vercel-labs/agent-skills --skill <name>`
- Target the agent: add `-a claude-code`
- Browse before installing: add `--list`

01 · CLEANER CODE

react-best-practices

70 React and Next.js performance rules from Vercel Engineering, applied as you write and refactor.

— Install: `--skill react-best-practices`

02 · ACCESSIBILITY & UX

web-design-guidelines

Say "review my UI" and it audits your interface against web design and accessibility guidelines.

— Install: `--skill web-design-guidelines`

03 · SHIP IT

deploy-to-vercel

"Push this live" — the agent
deploys your app and hands back
a preview URL, no context-switch.

— Install: `--skill deploy-to-vercel`

04 · CUT COST & LATENCY

vercel-optimize

Pulls real metrics first, then gives ranked, evidence-backed fixes: bill, slow routes, caching, Core Web Vitals.

— Install: `--skill vercel-optimize`

05 · THE META-SKILL

find-skills

Ask "is there a skill for X?" and it searches the skills.sh directory and installs the best match for you.

- `npx skills add vercel-labs/skills --skill find-skills`
- Then: `npx skills find <query>`

DO THIS TODAY

Start with one.

Install find-skills, then just ask your agent for what you need and let it pull the rest. One skill compounds into a whole workflow.
